$$\frac{\frac{f : A \rightarrow B}{f_* : A \rightarrow [A \multimap B]} \quad a : !\top \multimap A}{f_* a : A \multimap B}$$

$\mathcal{C}_!$  is a model of differential  $\lambda$ -calculus where we can transpose linear arrows:

$$\frac{f : A \rightarrow B}{Df : A \times A \rightarrow B} \quad (\text{in } \mathcal{C}_!, E \times F := E \& F)$$

# Dialectica and (Categorical) Differentiation

$$\sim_B \subseteq \{\vdash_{\mathbf{P}} M : W(B)\} \times \mathcal{C}_!(\top, B)$$

$$\bowtie_B^A \subseteq \{\vdash_{\mathbf{P}} M : C(B) \rightarrow \mathcal{M}[C(A)]\} \times \mathcal{C}_!(A, B) \times \mathcal{C}(B^\perp, A^\perp)$$

$M \sim_{E \rightarrow F} f$	<p>for all <math>H \sim_E e</math>, we have <math>M^1 H \sim_F f _e : F</math></p> <p>and <math>\lambda \pi. M^2 \langle H, \pi \rangle \bowtie_F^E \left( \begin{array}{c} \lambda^{-1} f : E \rightarrow F \\ ((\lambda^{-1} f)_* e)^\perp : F^\perp \multimap E^\perp \end{array} \right)</math></p>
$M \bowtie_{E \rightarrow F}^A \left( \begin{array}{c} f \\ g \end{array} \right)$	<p>for all <math>H \sim_E e</math>, we have</p> <p><math>\lambda \pi. M \langle H, \pi \rangle \bowtie_F^A \left( \begin{array}{c} f _e : A \rightarrow F \\ g^\perp _e^\perp : F^\perp \multimap A^\perp \end{array} \right)</math></p>

# The theorem

Let  $\mathbf{x} : A \vdash_{\Lambda} \mathbf{M} : B$ . Then:

$$1) \quad (\lambda \mathbf{x} . \mathbf{M})^{\bullet} \quad \sim_{A \rightarrow B} \quad \llbracket \lambda \mathbf{x} . \mathbf{M} \rrbracket : [A \rightarrow B]$$

$$2) \quad (\lambda \mathbf{x} . \mathbf{M}_{\mathbf{x}}) \mathbf{N} \quad \bowtie_B^A \quad \left( \begin{array}{ll} \llbracket \mathbf{M} \rrbracket & : \quad A \rightarrow B \\ (\llbracket \mathbf{M} \rrbracket_* a)^{\perp} & : \quad B^{\perp} \multimap A^{\perp} \end{array} \right) \quad \text{for all } \mathbf{N} \sim_A a.$$

Moral:

$$(\lambda \mathbf{x} . \mathbf{M}^{\bullet}, \lambda \mathbf{x} . \mathbf{M}_{\mathbf{x}})$$

“represents” the pair  $(\llbracket \mathbf{M} \rrbracket, R[\llbracket \mathbf{M} \rrbracket])$ , where

$$R[\llbracket \mathbf{M} \rrbracket] : A \times B^{\perp} \rightarrow A^{\perp}$$

is the reverse differential of  $\llbracket \mathbf{M} \rrbracket$ .

## Reflection moment

Yet, can we say that Dialectica really *is* (reverse) Differentiation?

## Reflection moment

Yet, can we say that Dialectica really *is* (reverse) Differentiation?

- All Dialectica transformation/only the transformation of  $\lambda$ -calculus.  
What about quantifiers?

## Reflection moment

Yet, can we say that Dialectica really *is* (reverse) Differentiation?

- All Dialectica transformation/only the transformation of  $\lambda$ -calculus.  
What about quantifiers?  
Counterexample (thanks to Thomas Powell), but that's another topic...

## Reflection moment

Yet, can we say that Dialectica really *is* (reverse) Differentiation?

- All Dialectica transformation/only the transformation of  $\lambda$ -calculus.  
What about quantifiers?  
Counterexample (thanks to Thomas Powell), but that's another topic...
- The main feature of Dialectica is that in the target we have (e.g.) binary predicates (non-trivial subobjects in Dialectica categories). Here we don't: aren't we lose something about Dialectica?

## Reflection moment

What about quantifiers?  
Counterexample (thanks to Thomas Powell), but that's another topic...
- The main feature of Dialectica is that in the target we have (e.g.) binary predicates (non-trivial subobjects in Dialectica categories). Here we don't: aren't we lose something about Dialectica?  
Not really, we are just formulating it differently.

## Reflection moment

Yet, can we say that Dialectica really *is* (reverse) Differentiation?

- All Dialectica transformation/only the transformation of  $\lambda$ -calculus.  
What about quantifiers?  
Counterexample (thanks to Thomas Powell), but that's another topic...
- The main feature of Dialectica is that in the target we have (e.g.) binary predicates (non-trivial subobjects in Dialectica categories). Here we don't: aren't we lose something about Dialectica?  
Not really, we are just formulating it differently.
- Is this correspondence astonishing/magic? Can we find some “reason” clarifying it?

## Reflection moment

- All Dialectica transformation/only the transformation of  $\lambda$ -calculus.  
What about quantifiers?  
Counterexample (thanks to Thomas Powell), but that's another topic...
- The main feature of Dialectica is that in the target we have (e.g.) binary predicates (non-trivial subobjects in Dialectica categories). Here we don't: aren't we lose something about Dialectica?  
Not really, we are just formulating it differently.
- Is this correspondence astonishing/magic? Can we find some "reason" clarifying it?  
Definitely yes at first sight... but then we can clearly understand its reason by looking at the categorical framework behind it.

# Lens Categories

The category  $\text{Lens}(\mathcal{L})$  of lenses over  $\mathcal{L}$  is defined as follows:

- objects: arrows in  $\mathcal{L}$ , which we think as fibre bundles and we write  $p : \binom{\alpha}{A}$
- arrows from  $p : \binom{\alpha}{A}$  to  $q : \binom{\beta}{B}$  are the data of both a  $f : A \rightarrow B$  in  $\mathcal{L}$  and a span  $\alpha \xleftarrow{F} f^*\beta \xrightarrow{\bar{f}} \beta$  in  $\mathcal{L}$ , taken from the following pullback diagram:

$$\begin{array}{ccccc}
 \alpha & \xleftarrow{F} & f^*\beta & \xrightarrow{\bar{f}} & \beta \\
 & \searrow p & \downarrow f^*q & \lrcorner & \downarrow q \\
 & & A & \xrightarrow{f} & B
 \end{array}$$

# Lens Categories

The category  $\text{Lens}(\mathcal{L})$  of lenses over  $\mathcal{L}$  is defined as follows:

- objects: arrows in  $\mathcal{L}$ , which we think as fibre bundles and we write  $p : \binom{\alpha}{A}$
- arrows from  $p : \binom{\alpha}{A}$  to  $q : \binom{\beta}{B}$  are the data of both a  $f : A \rightarrow B$  in  $\mathcal{L}$  and a span  $\alpha \xleftarrow{F} f^*\beta \xrightarrow{\bar{f}} \beta$  in  $\mathcal{L}$ , taken from the following pullback diagram:

$$\begin{array}{ccccc}
 \alpha & \xleftarrow{F} & f^*\beta & \xrightarrow{\bar{f}} & \beta \\
 & \searrow p & \downarrow f^*q & \lrcorner & \downarrow q \\
 & & A & \xrightarrow{f} & B
 \end{array}$$

Let  $\mathcal{ELens}(\mathcal{L})$  be the full subcategory of  $\text{Lens}(\mathcal{L})$  of trivial bundles, i.e. first projections. Concretely:

- Objects are first projections  $\pi_1 : \binom{A \times X}{A}$
- An arrow from  $\pi_1 : \binom{A \times X}{A}$  to  $\pi_1 : \binom{B \times Y}{B}$  is given by an  $f : A \rightarrow B$  and a span  $A \times X \xleftarrow{F} A \times Y \xrightarrow{f \times 1} B \times Y$  such that  $F; \pi_1^{A,X} = \pi_1^{A,Y}$ .

# Differentiation through the lens of lenses

Let  $\mathcal{L}$  be a Cartesian (closed, if you want  $\lambda$ -calculus) differential category where from the differential  $Df$  of a function  $f$  (a primitive data in  $\mathcal{L}$ ) we can define the reverse differential  $Rf$  of  $f$ . (Think of  $\mathcal{L} := \mathcal{C}_!$  of the first part).

# Differentiation through the lens of lenses

Let  $\mathcal{L}$  be a Cartesian (closed, if you want  $\lambda$ -calculus) differential category where from the differential  $Df$  of a function  $f$  (a primitive data in  $\mathcal{L}$ ) we can define the reverse differential  $Rf$  of  $f$ . (Think of  $\mathcal{L} := \mathcal{C}_!$  of the first part).

We have a functor  $\mathcal{L} \rightarrow \mathcal{ELens}(\mathcal{L})$  defined by:

$$A \quad \mapsto \quad \pi_1 : \left( A \times A^\perp \right)_A$$

$$A \xrightarrow{f} B \quad \mapsto \quad \left( f, \quad A \times A^\perp \xleftarrow{\langle \pi_1, Rf \rangle} A \times B^\perp \xrightarrow{f \times 1} B \times B^\perp \right).$$

# Differentiation through the lens of lenses

Let  $\mathcal{L}$  a Cartesian reverse differential category.

# Differentiation through the lens of lenses

Let  $\mathcal{L}$  a Cartesian reverse differential category.

We have a functor  $\mathcal{L} \rightarrow \mathcal{ELens}(\mathcal{L})$  defined by:

$$\begin{aligned} A &\mapsto \pi_1 : \left( \begin{smallmatrix} A \times A \\ A \end{smallmatrix} \right) \\ A \xrightarrow{f} B &\mapsto \left( f, A \times A \xleftarrow{\langle \pi_1, Rf \rangle} A \times B \xrightarrow{f \times 1} B \times B \right) \end{aligned}$$

where  $Rf : A \times B \rightarrow A$  is the reverse differential of  $f$  (a primitive data in  $\mathcal{L}$ ).

# Differentiation through the lens of lenses

Let  $\mathcal{L}$  be a reverse tangent category. This means that  $\mathcal{L}$  has a tangent functor  $T$  giving tangent bundles  $p_A : (T^A_A)$  of objects  $A$  and giving tangent arrows  $Tf : TA \rightarrow TB$  for arrows  $f : A \rightarrow B$ , and we can “reverse”  $T$  in order to get cotangent bundles  $p_A^* : (T^{*A}_A)$  and arrows in the pullback diagram below:

$$\begin{array}{ccccc}
 T^*A & \xleftarrow{T^*f} & f^*T^*B & \xrightarrow{\bar{f}} & T^*B \\
 & \searrow p_A^* & \downarrow f^*p_B & \lrcorner & \downarrow p_B^* \\
 & & A & \xrightarrow{f} & B
 \end{array}$$

where  $T^*f$  is the diff. geometry formulation of the reverse differential of  $f$ .

## Differentiation through the lens of lenses

Let  $\mathcal{L}$  be a reverse tangent category. This means that  $\mathcal{L}$  has a tangent functor  $T$  giving tangent bundles  $p_A : (T^A_A)$  of objects  $A$  and giving tangent arrows  $Tf : TA \rightarrow TB$  for arrows  $f : A \rightarrow B$ , and we can “reverse”  $T$  in order to get cotangent bundles  $p_A^* : (T^{*A}_A)$  and arrows in the pullback diagram below:

$$\begin{array}{ccccc}
 T^*A & \xleftarrow{T^*f} & f^*T^*B & \xrightarrow{\bar{f}} & T^*B \\
 & \searrow p_A^* & \downarrow f^*p_B & \lrcorner & \downarrow p_B^* \\
 & & A & \xrightarrow{f} & B
 \end{array}$$

where  $T^*f$  is the diff. geometry formulation of the reverse differential of  $f$ .

We have a functor  $\mathcal{L} \rightarrow \text{Lens}(\mathcal{L})$  defined by:

$$A \mapsto p_A^* : (T^{*A}_A)$$

$$A \xrightarrow{f} B \mapsto (f, T^*A \xleftarrow{T^*f} f^*T^*B \xrightarrow{\bar{f}} T^*B).$$

# Expressing Dialectica as a functor

$$\Lambda_{\text{cat}} \rightarrow \mathcal{E}\text{Lens}(\mathbf{P}_{\text{cat}})$$

# Expressing Dialectica as a functor

$$\Lambda_{\text{cat}} \rightarrow \mathcal{ELens}(\mathbf{P}_{\text{cat}})$$

- An object  $A$  is sent to the typed term  $\mathbf{z} : W(A) \times \mathcal{M}[C(A)] \vdash_{\mathbf{P}} \mathbf{z}^1 : W(A)$
- An arrow  $\mathbf{z} : A \vdash_{\Lambda} M : B$  in  $\Lambda_{\text{cat}}$  from  $A$  to  $B$  is sent to the **arrow** in  $\mathcal{ELens}(\mathbf{P}_{\text{cat}})$  from  $\mathbf{z} : W(A) \times \mathcal{M}[C(A)] \vdash_{\mathbf{P}} \mathbf{z}^1 : W(A)$  to  $\mathbf{z} : W(B) \times \mathcal{M}[C(B)] \vdash_{\mathbf{P}} \mathbf{z}^1 : W(B)$  given by the following diagram:

$$\begin{array}{ccccc}
 W(A) \times \mathcal{M}[C(A)] & \xleftarrow{\langle \mathbf{z}^1, (M_{\mathbf{z}^1})\mathbf{z}^2 \rangle} & W(A) \times \mathcal{M}[C(B)] & \xrightarrow{\langle M^\bullet, \mathbf{z}^2 \rangle} & W(B) \times \mathcal{M}[C(B)] \\
 & \searrow \mathbf{z}^1 & \downarrow \mathbf{z}^1 & \lrcorner & \downarrow \mathbf{z}^1 \\
 & & W(A) & \xrightarrow{M^\bullet} & W(B)
 \end{array}$$

# Expressing Dialectica as a functor

$$\Lambda_{\text{cat}} \rightarrow \mathcal{ELens}(\mathbf{P}_{\text{cat}})$$

Moral:

The Dialectica transformation of  $\lambda$ -calculus encodes (reverse) Differentiation *because* it is a transformation into a category of Lenses, the latter being the abstract setting for Reverse Differentiation.

## Final comments

- I didn't talk about Dialectica categories. I could have said something (ask me if you are interested)
- Explore categorical framework to reverse a Cartesian closed differential category in order to define Cartesian closed reverse differential/tangent categories
- Reverse differential  $\lambda$ -calculus? There is an interesting paper from Ong and Mak.

## Final comments

- I didn't talk about Dialectica categories. I could have said something (ask me if you are interested)
- Explore categorical framework to reverse a Cartesian closed differential category in order to define Cartesian closed reverse differential/tangent categories
- Reverse differential  $\lambda$ -calculus? There is an interesting paper from Ong and Mak.

THANK YOU!
